Complete a Breast Screen form for each annual screening or when patient returns for a planned short-term follow-up visit.

2. Symptoms reported by the patient can include: discrete mass/lump, dimpling/puckering, skin ulceration/scaliness/inflammation, nipple discharge, or non-cyclic pain.

5a. Select No breast abnormality to indicate a normal, within normal limits (WNL) or a negative clinical breast exam (CBE) overall assessment.

5b. Benign breast condition is selected when CBE findings are not of concern for cancer.

5c. Probably benign breast condition is selected when CBE findings indicate a need for follow-up in 3 to 6 months.

5d. Abnormality is selected to indicate a CBE with abnormal findings suspicious for breast cancer (same as symptoms listed above in #2). Immediate diagnostic procedures are needed even if mammogram is Negative or Benign.

6a. CBE may not be needed if a normal or benign CBE was performed within last 12 months (even if done elsewhere), or may not be needed per PCP discretion.

6b. Normally performed for these patients.

6c. Mammogram may not be needed at this time if the prior mammogram was normal, benign, or probably benign and was done within last 12 months, or may not be needed per PCP discretion.

6e. Highly suggestive of cancer. Biopsy indicated. Must do additional procedures as part of Immediate Work-up. Submit diagnostic procedures and dates on a Breast Follow-up form.

6f. Need additional imaging evaluation. Next Step is Immediate Work-up. Submit diagnostic procedures and dates on a Breast Follow-up form.

6g. Select Immediate Work-up as Next Step and order new mammogram.

6h. Mammogram may not be needed at this time if the prior mammogram was normal, benign, or probably benign and was done within last 12 months, or may not be needed per PCP discretion.

6i. Select Routine Rescreen only when both the CBE and Mammogram are normal/benign. The current Worksheet is done: submit data online now. Do not use a Breast Follow-up form.

6j. Select Immediate Work-up when diagnostic procedures are required without delay to rule out breast cancer. Same-day Ultrasound is considered an Immediate Work-up. Complete the Breast Follow-up form for these patients.

6k. Select Short-Term Follow-up when the patient requires more procedures after a 3 to 6 month planned delay. The current Worksheet is done: submit data online now. Do not use a Breast Follow-up form. Start a new Worksheet when patient returns for short-term follow-up.

* CDP:EWC requires Immediate Work-up as the Next Step, and diagnostic procedures for any of the following Breast Screen results:
   1) CBE: Abnormality, rule out breast cancer
   2) Mammogram: Suspicious abnormality
   3) Mammogram: Highly suggestive of malignancy
   4) Mammogram: Assessment incomplete

Record diagnostic procedures, diagnostic status, and final diagnosis on a Breast Follow-up form.
